Name – Amit Shinde
Roll No. - 100
Batch – T22

EXPERIMENT 3

Aim: To Perform various GIT operations on local and Remote repositories.

Theory :

Directory and File Commands

- **mkdir git**
  Creates a new directory (folder) named "git" in the current working directory. This command is used to create a new directory in Unix-like operating systems.
- **cd git**
  Changes the current working directory to the directory named "git." After executing this command, all subsequent commands or file operations will occur within the "git" directory.
  Note: "cd" stands for "change directory."
- **nano index.html**
  Opens the Nano text editor for the file named "index.html." Nano is a simple command-line text editor that allows you to view and edit files directly in the terminal.
- **touch teststatus**

  Creates an empty file named "teststatus" in the current directory. The `touch` command is commonly used to update the timestamps of a file or create an empty file if it doesn't exist.
- **git checkout -- teststatus**
  Discards changes to the file "teststatus" in the working directory. This reverts the file to the state it has in the last commit.

Git Configuration

- **git config --global user.name "Your Name"**
  Sets your global Git username, which will be associated with your commits.
- **git config --global user.email "youremail@example.com"**
  Sets your global Git email address, which will be associated with your commits.
- **git config --list**
  Displays the current configuration settings for Git, including user details and other preferences.

Staging and Committing Changes

- **`git add <file>`**
  Stages changes in the working directory for the next commit in Git. It prepares modifications, additions, or deletions to be included in the upcoming commit.
- **`git commit -am "commit message"`**
  Stages and commits all changes in tracked files with a commit message in a single command. This is a shorthand for `git add <file>` followed by `git commit`.
- **`git log`**
  Displays the commit history of the Git repository, showing a chronological list of commits, including commit hashes, author information, timestamps, and commit messages.
- **`git log --oneline`**
  Displays a simplified, one-line representation of the commit history, showing only the commit SHA-1 hash and the commit message.

Git Remote Operations

- **`git clone <repository>`**
  Creates a copy of a Git repository. This command duplicates the entire repository (files, commit history, branches) and downloads it to your local machine. It is often the initial step when working with a project hosted on a remote Git repository.
- **`git pull`**
  Fetches and integrates changes from a remote repository into the current branch of your local repository. It combines two actions: it fetches changes from the remote repository and merges them into your local branch.
- **`git push`**
  Uploads or pushes local changes from your Git repository to a remote repository. It updates the remote repository with the latest changes made in your local branch.
- **`git fetch`**
  Retrieves changes from a remote repository, including new branches or changes made since your last interaction. However, it does not automatically merge these changes into your local branches. After using `git fetch`, you can inspect the changes and decide whether to integrate them using `git merge` or `git rebase`.

```
Lab203@203-003 MINGW64 ~/git-dvcs43 (master)
$ git config --global
usage: git config [<options>]

Config file location
    --[no-]global           use global config file
    --[no-]system           use system config file
    --[no-]local            use repository config file
    --[no-]worktree         use per-worktree config file
    -f, --[no-]file <file>
                            use given config file
    --[no-]blob <blob-id> read config from given blob object

Action
    --[no-]get              get value: name [value-pattern]
    --[no-]get-all          get all values: key [value-pattern]
    --[no-]get-regexp       get values for regexp: name-regex [value-pattern]
    --[no-]get-urlmatch     get value specific for the URL: section[.var] URL
    --[no-]replace-all      replace all matching variables: name value [value-patt
ern]
    --[no-]add              add a new variable: name value
    --[no-]unset            remove a variable: name [value-pattern]
    --[no-]unset-all        remove all matches: name [value-pattern]
    --[no-]rename-section rename section: old-name new-name
    --[no-]remove-section remove a section: name
    -l, --[no-]list         list all
    --[no-]fixed-value      use string equality when comparing values to 'value-pa
ttern'
    -e, --[no-]edit         open an editor
    --[no-]get-color        find the color configured: slot [default]
    --[no-]get-colorbool  find the color setting: slot [stdout-is-tty]

Type
    -t, --[no-]type <type>
                            value is given this type
    --bool                  value is "true" or "false"
    --int                   value is decimal number
    --bool-or-int           value is --bool or --int
    --bool-or-str           value is --bool or string
    --path                  value is a path (file or directory name)
    --expiry-date           value is an expiry date

Other
    -z, --[no-]null         terminate values with NUL byte
    --[no-]name-only        show variable names only
    --[no-]includes         respect include directives on lookup
    --[no-]show-origin      show origin of config (file, standard input, blob, com
mand line)
    --[no-]show-scope       show scope of config (worktree, local, global, system,
 command)
    --[no-]default <value>
                            with --get, use default value when missing entry
```

```
15L@203-005 MINGW64 ~/git-dvcs (master)
$  mkdir git-demo-project

15L@203-005 MINGW64 ~/git-dvcs (master)
$ cd git-demo-project/

15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$  git init
Initialized empty Git repository in C:/Users/15L/git-dvcs/git-demo-project/.git/
```

```
15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ ls -a
./   ../   .git/

15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ ls -al
total 4
drwxr-xr-x 1 15L 197121 0 Feb 12 11:10 ./
drwxr-xr-x 1 15L 197121 0 Feb 12 11:10 ../

$ git add .

15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git status
On branch master
```

```
15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git commit -m "First Commit"
[master (root-commit) 54ca444] First Commit
 1 file changed, 1 insertion(+)
 create mode 100644 index.html
```

```
15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git status
On branch master
Untracked files:
  (use "git add <file>..." to include in what will be committed)
        index.htm

nothing added to commit but untracked files present (use "git add" to track)
```

```
15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git add index.htm

15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git status
On branch master
Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
        new file:   index.htm
```

```
15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git commit -am "Express commit"
[master 9404a12] Express commit
 1 file changed, 1 insertion(+)
 create mode 100644 index.htm

15L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git status
On branch master
nothing to commit, working tree clean
```

```
L5L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git log
commit 9404a121df804bff5b7ed0f5304521509dfdc632 (HEAD -> master)
Author: ashvika <ashvikavk@gmail.com>
Date:   Wed Feb 12 11:35:09 2025 +0530

    Express commit

commit 54ca444578d21cdb937f12faa216b08c43bbf9de
```

```
L5L@203-005 MINGW64 ~/git-dvcs/git-demo-project (master)
$ git log --oneline
9404a12 (HEAD -> master) Express commit
54ca444 First Commit
```

Conclusion : Successfully performed various GIT operations on local and Remote repositories.
